16-Channel, Constant-Current LED Driver with LED Open Detection

Check for Samples: TLC5928

FEATURES

- **16 Channels, Constant-Current Sink Output with On/Off Control**
- **35-mA Capability (Constant-Current Sink)**
- **10-ns High-Speed Constant-Current Switching Transient Time**
- **Low On-Time Error**
- **LED Power-Supply Voltage up to 17 V**
- **V_{CC} = 3.0 V to 5.5 V**
- **Constant-Current Accuracy:**
  - **Channel-to-Channel = ±1%**
  - **Device-to-Device = ±1%**
- **CMOS Logic Level I/O**
- **35-MHz Data Transfer Rate**
- **20-ns BLANK Pulse Width**
- **Readable Error Information:**
  - **LED Open Detection (LOD)**
  - **Pre-Thermal Warning (PTW)**
- **Operating Temperature: −40°C to +85°C**

APPLICATIONS

- **LED Video Displays**
- **Message Boards**
- **Illumination**

DESCRIPTION

The TLC5928 is a 16-channel, constant-current sink LED driver. Each channel can be turned on/off by writing serial data to an internal register. The constant-current value of all 16 channels is set by a single external resistor.

The TLC5928 has two error detection circuits: one for LED open detection (LOD) and one for a pre-thermal warning (PTW). LOD detects a broken or disconnected LED and LEDs shorted to GND while the constant-current output is on. PTW indicates a high temperature condition.
Typical Application Circuit (Multiple Daisy-Chained TLC5928s)

TLC5928

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE/ORDERING INFORMATION[1]

PRODUCT	PACKAGE-LEAD	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY
TLC5928	SSOP-24/QSOP-24	TLC5928DBQR	Tape and Reel, 2500
		TLC5928DBQ	Tube, 50
TLC5928	TSSOP-24	TLC5928PWR	Tape and Reel, 2000
		TLC5928PW	Tube, 60
TLC5928	HTSSOP-24 PowerPAD™	TLC5928PWPR	Tape and Reel, 2000
		TLC5928PWP	Tube, 60
TLC5928	QFN-24	TLC5928RGER	Tape and Reel, 3000
		TLC5928RGE	Tape and Reel, 250

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or visit the device product folder at www.ti.com.

ABSOLUTE MAXIMUM RATINGS[1][2]

Over operating free-air temperature range, unless otherwise noted.

PARAMETER			TLC5928	UNIT
V_{CC}	Supply voltage: V_{CC}		–0.3 to +6.0	V
I_{OUT}	Output current (dc)	OUT0 to OUT15	40	mA
V_{IN}	Input voltage range	SIN, SCLK, LAT, BLANK, IREF	–0.3 to V_{CC} + 0.3	V
V_{OUT}	Output voltage range	SOUT	–0.3 to V_{CC} + 0.3	V
		OUT0 to OUT15	–0.3 to +18	V
$T_{J(MAX)}$	Operating junction temperature		+150	°C
T_{STG}	Storage temperature range		–55 to +150	°C
	ESD rating	Human body model (HBM)	2	kV
		Charged device model (CDM)	500	V

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not supported.
(2) All voltage values are with respect to network ground terminal.

DISSIPATION RATINGS

PACKAGE	OPERATING FACTOR ABOVE T_A = +25°C	T_A < +25°C POWER RATING	T_A = +70°C POWER RATING	T_A = +85°C POWER RATING
SSOP-24/QSOP-24	14.3 mW/°C	1782 mW	1140 mW	927 mW
TSSOP-24	9.6 mW/°C	1194 mW	764 mW	621 mW
HTSSOP-24[1]	28.9 mW/°C	3611 mW	2311 mW	1878 mW
QFN-24[2]	24.8 mW/°C	3106 mW	1988 mW	1615 mW

(1) With PowerPAD soldered onto copper area on printed circuit board (PCB); 2 oz. copper. For more information, see SLMA002 (available for download at www.ti.com).
(2) The package thermal impedance is calculated in accordance with JESD51-5.

RECOMMENDED OPERATING CONDITIONS

At T_A= –40°C to +85°C, unless otherwise noted.

I_{OLC}	Constant output current	All OUTn = ON, V_{OUTn} = V_{OUTfix} = 1 V, R_{IREF} = 1.5 kΩ (see Figure 6), at OUT0 to OUT15	31	34	37	mA
I_{OLKG}	Output leakage current	All OUTn for constant-current driver, all outputs off BLANK = high, V_{OUTn} = V_{OUTfix} = 17 V, R_{IREF} = 1.5 kΩ (see Figure 6), at OUT0 to OUT15			0.1	μA
ΔI_{OLC}	Constant-current error (channel-to-channel)[1]	All OUTn = ON, V_{OUTn} = V_{OUTfix} = 1 V, R_{IREF} = 1.5 kΩ at OUT0 to OUT15		±1	±3	%
ΔI_{OLC1}	Constant-current error (device-to-device)[2]	All OUTn = ON, V_{OUTn} = V_{OUTfix} = 1 V, R_{IREF} = 1.5 kΩ at OUT0 to OUT15		±1	±6	%
ΔI_{OLC2}	Line regulation[3]	All OUTn = ON, V_{OUTn} = V_{OUTfix} = 1 V, R_{IREF} = 1.5 kΩ at OUT0 to OUT15		±0.5	±1	%/V
ΔI_{OLC3}	Load regulation[4]	All OUTn = ON, V_{OUTn} = 1 V to 3V, V_{OUTfix} = 1 V, R_{IREF} = 1.5 kΩ, at OUT0 to OUT15		±1	±3	%/V
$T_{(PTW)}$	Pre-thermal warning threshold	Junction temperature[5]	+125	+138	+150	°C
V_{LOD}	LED open detection threshold	All OUTn = ON	0.25	0.30	0.35	V
V_{IREF}	Reference voltage output	R_{IREF} = 1.5 kΩ	1.16	1.20	1.24	V

(1) The deviation of each output from the average of OUT0–OUT15 constant-current. Deviation is calculated by the formula:

$$\Delta\,(\%) = \left| \frac{I_{OUTn}}{\dfrac{(I_{OUT0} + I_{OUT1} + ... + I_{OUT14} + I_{OUT15})}{16}} - 1 \right| \times 100 \ .$$

(2) The deviation of the OUT0–OUT15 constant-current average from the ideal constant-current value.
Deviation is calculated by the following formula:

$$\Delta\,(\%) = \left[\frac{\dfrac{(I_{OUT0} + I_{OUT1} + ... I_{OUT14} + I_{OUT15})}{16} - (\text{Ideal Output Current})}{\text{Ideal Output Current}} \right] \times 100$$

Ideal current is calculated by the formula:

$$I_{OUT(IDEAL)} = 42 \times \left[\frac{1.20}{R_{IREF}} \right]$$

(3) Line regulation is calculated by this equation:

$$\Delta\,(\%/V) = \left[\frac{(I_{OUTn} \text{ at } V_{CC} = 5.5\,V) - (I_{OUTn} \text{ at } V_{CC} = 3.0\,V)}{(I_{OUTn} \text{ at } V_{CC} = 3.0\,V)} \right] \times \frac{100}{5.5\,V - 3\,V}$$

(4) Load regulation is calculated by the equation:

$$\Delta\,(\%/V) = \left[\frac{(I_{OUTn} \text{ at } V_{OUTn} = 3\,V) - (I_{OUTn} \text{ at } V_{OUTn} = 1\,V)}{(I_{OUTn} \text{ at } V_{OUTn} = 1\,V)} \right] \times \frac{100}{3\,V - 1\,V}$$

(5) Not tested. Specified by design.

TERMINAL FUNCTIONS

TERMINAL				
NAME	DBQ/PW/ PWP	RGE	I/O	DESCRIPTION
SIN	2	23	I	Serial data input for driver on/off control. When SIN = high level, data '1' are written into LSB of the on/off control shift register at the rising edge of SCLK.
SCLK	3	24	I	Serial data shift clock. Schmitt buffer input. All data in the on/off control shift register are shifted toward the MSB by 1-bit synchronization of SCLK. A rising edge on SCLK is allowed 100 ns after a rising edge of LAT.
LAT	4	1	I	Edge triggered latch. The data in the on/off control data shift register are transferred to the on/off control data latch at this rising edge. At the same time, the data in the on/off control shift register are replaced with LED open detection (LOD) and pre-thermal warning (PTW) data. LAT must be toggled only once after the shift data are updated to avoid the on/off control latch data being replaced with LOD and PTW data in the shift register.
BLANK	21	18	I	Blank, all outputs. When BLANK = high level, all constant-current outputs (OUT0–OUT15) are forced off. When BLANK = low level, all constant-current outputs are controlled by the on/off control data in the data latch. LOD and PTW data are latched into the SID data latch at the rising edge of BLANK and are present at the output of the SID data latch when BLANK is low.
IREF	23	20	I/O	Constant-current value setting, OUT0–OUT15 sink constant-current is set to desired value by connection to an external resistor between IREF and GND.
SOUT	22	19	O	Serial data output. This output is connected to the MSB of the on/off data shift register. SOUT data changes at the rising edge of SCLK.
OUT0	5	2	O	Constant-current output. Each output can be tied together with others to increase the constant-current. Different voltages can be applied to each output.
OUT1	6	3	O	Constant-current output
OUT2	7	4	O	Constant-current output
OUT3	8	5	O	Constant-current output

DETAILED DESCRIPTION

SETTING FOR THE CONSTANT SINK CURRENT VALUE

The constant-current values are determined by an external resistor (R_{IREF}) placed between IREF and GND. The resistor (R_{IREF}) value is calculated by Equation 1.

$$R_{IREF} \text{ (k}\Omega\text{)} = \frac{V_{IREF} \text{ (V)}}{I_{OLC} \text{ (mA)}} \times 42$$

Where:

V_{IREF} = the internal reference voltage on the IREF pin (typically 1.20 V)   (1)

I_{OLC} must be set in the range of 2 mA to 35 mA. The constant sink current characteristic for the external resistor value is shown in Figure 10. Table 1 describes the constant-current output versus external resistor value.

Table 1. Constant-Current Output versus External Resistor Value

I_{OLCMax} (mA, Typical)	R_{IREF} (kΩ)
35	1.44
30	1.68
25	2.02
20	2.52
15	3.36
10	5.04
5	10.1
2	25.2

CONSTANT-CURRENT DRIVER ON/OFF CONTROL

When BLANK is low, the corresponding output is turned on if the data in the on/off control data latch are '1' and remains off if the data are '0'. When BLANK is high, all outputs are forced off. This control is shown in Table 2.

Table 2. On/Off Control Data Truth Table

ON/OFF CONTROL LATCH DATA	CONSTANT-CURRENT OUTPUT STATUS
0	Off
1	On

When the IC is initially powered on, the data in the on/off control shift register and data latch are not set to the respective default value. Therefore, the on/off control data must be written to the data latch before turning the constant-current output on. BLANK should be at a high level when powered on because the constant-current may be turned on as a result of random data in the on/off control latch.

The on/off data corresponding to any unconnected OUTn outputs should be set to '0' before turning on the remaining outputs. Otherwise, the supply current (I_{CC}) increases while the LEDs are on.

TEXAS INSTRUMENTS

REGISTER CONFIGURATION

The TLC5928 has an on/off control data shift register and data latch. Both the on/off control shift register and latch are 16 bits long and are used to turn on/off the constant-current drivers. Figure 17 shows the shift register and latch configuration. The data at the SIN pin are shifted in to the LSB of the shift register at the rising edge of the SCLK pin; SOUT data change at the rising edge of SCLK. The timing diagram for data writing is shown in Figure 18. The driver on/off is controlled by the data in the on/off control data latch.

The on/off data are latched into the data latch by a rising edge of LAT after the data are written into the on/off control shift register by SIN and SCLK. At the same time, the data in the on/off control shift register are replaced with LED open detection (LOD) and pre-thermal warning (PTW) data. Therefore, LAT must be input only once after the on/off data update to avoid the on/off control data latch being replaced with LOD and PTW data in the shift register. When the IC is initially powered on, the data in the on/off control shift register and latch are not set to the default values; on/off control data must be written to the on/off control data latch before turning the constant-current output on. BLANK should be high when the IC is powered on because the constant-current may be turned on at that time as a result of random values in the on/off data latch. All constant-current outputs are forced off when BLANK is high.
Figure 17. On/Off Control Shift Register and Latch Configuration
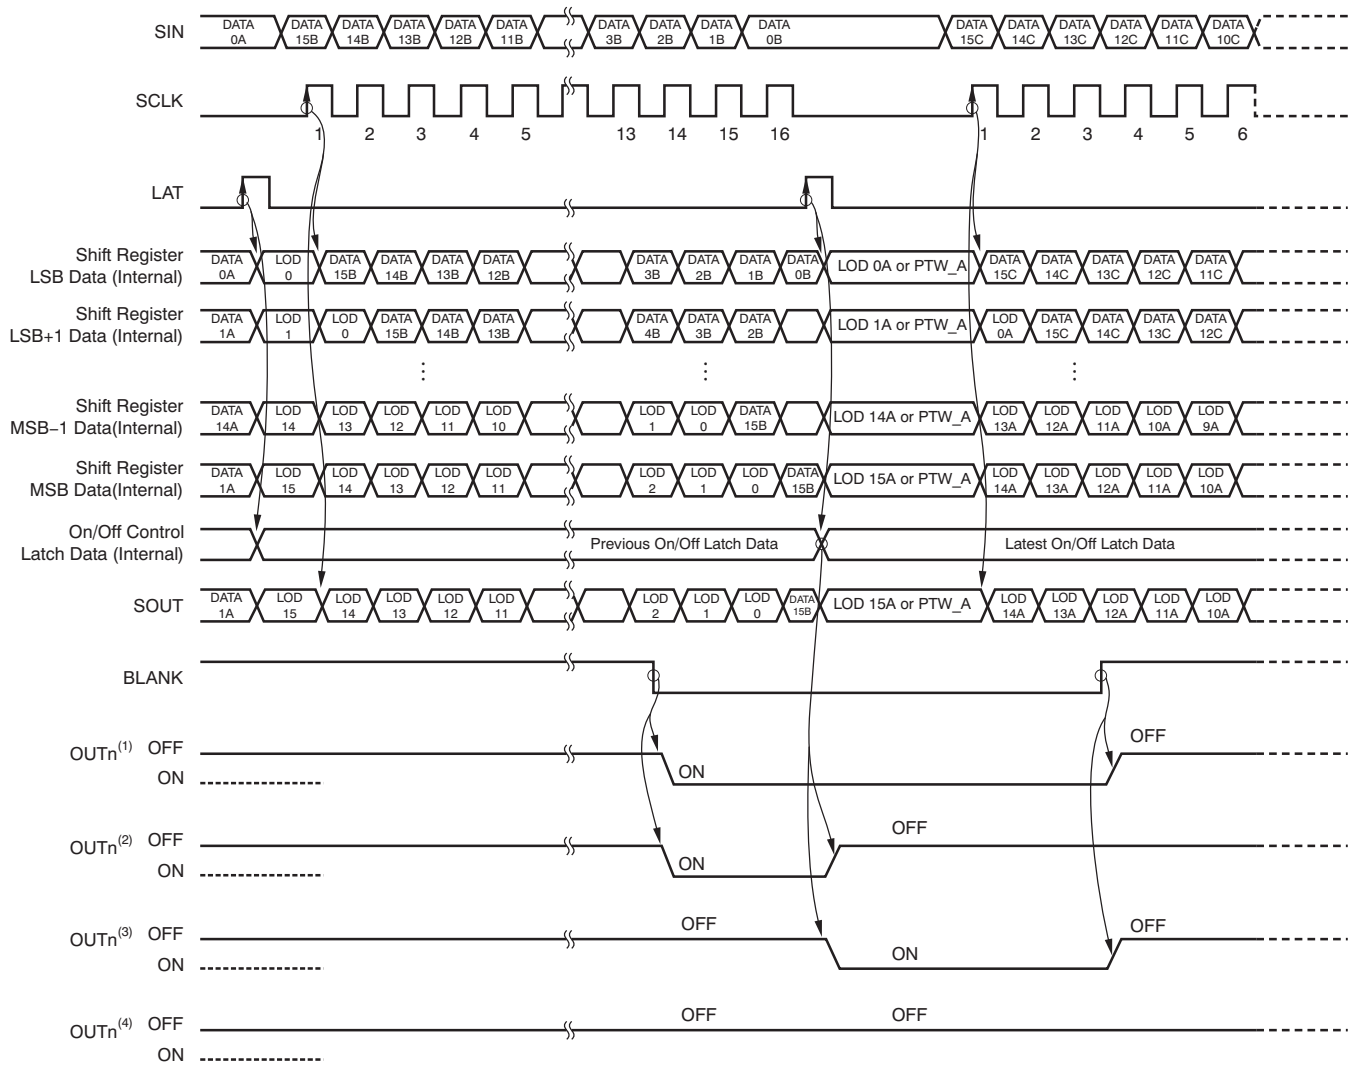

Product Folder Link(s): *TLC5928*

Figure 18. On/Off Control Operation

(1) On/off latched data are '1'.

(2) On/off latched data are changed from '1' to '0' at the second LAT signal.

(3) On/off latched data are changed from '0' to '1' at the second LAT signal.

(4) On/off latched data are '0'.

LED OPEN DETECTION (LOD) AND PRE-THERMAL WARNING (PTW)

The LED open detection (LOD) circuit checks the voltage of each active (that is, on) constant-current sink output (OUT0 through OUT15) to detect open LEDs and LEDs shorted to GND while BLANK is low. The LOD bits in the status information data register (SID) are set to '1' if the voltage of the corresponding OUTn pin is less than the LED open detection threshold (V_{LOD} = 0.3 V, typ). The status information data can be read from the SOUT pin. To avoid false detection of open LEDs, the LED driver design must ensure that the constant-current sink output voltage is greater than 0.3 V when the outputs are on. Also, the output on-time must be 1 µs or greater to correctly read the valid LOD status.

The PTW function indicates that the IC junction temperature is too high. The PTW bit in the SID data is set to '1' while the IC junction temperature exceeds the temperature threshold ($T_{(PTW)}$ = +138 °C, typ). If the IC junction temperature decreases below the temperature of $T_{(PTW)}$, the SID data are set depending on the LOD function. The constant-current outputs are not forced off during PTW conditions, so the controller should take appropriate action (such as reducing the duty cycle of effected channels).

The LOD and PTW data are latched into the SID latch with the rising edge of BLANK and do not change until BLANK goes low. The SID data latched in the latch are transferred into the on/off shift register with a rising edge of LAT. SID can be shifted out from SOUT with rising edges of SCLK. The data in the on/off control shift register are replaced with the LOD and PTW data at the rising edge of LAT. Therefore, LAT should be input only once after the shift data are updated to avoid the on/off control data latch information from being replaced with LOD and PTW data in the shift register. A timing diagram for LOD, PTW, and SID is shown in Figure 19.

Figure 19. LOD/PTW/SID timing

Product Folder Link(s): *TLC5928*

STATUS INFORMATION DATA (SID)

The latched LED open detection (LOD) error and pre-thermal warning (PTW) in the SID data latch are shifted out onto the SOUT pin with each rising edge of SCLK. If a PTW is reported, all LOD error bits are set to '1'. The SID data are written over the data in the on/off control shift register at the rising edge of LAT. Therefore, the previous data in the on/off control shift register are lost when SID information is latched in. Figure 20 shows the SID bit assignments. See Figure 7 for the read timing of SID.

When the IC is powered on, the initial LOD data are invalid. Therefore, LOD data must be read after the rising edge of BLANK. Table 3 shows a truth table for LOD and PTW.

Table 3. LOD and PTW Truth Table

	CONDITION	SID DATA
LED open detection (LODn)	LED is connected ($V_{OUTn} > V_{LOD}$)	'0' (low level at SOUT)
	LED is opened or shorted to GND ($V_{OUTn} ≤ V_{LOD}$ and output on)	'1' (high level at SOUT); set to the bit that has an LED error condition
Pre-thermal warning (PTW)	IC temperature is low (IC temperature ≤ $T_{(PTW)}$)	Depend LED open error
	IC temperature is high (IC temperature > $T_{(PTW)}$)	All bits = '1' (high level at SOUT)
Figure 20. Status Information Data Configuration

LAYOUT CONSIDERATIONS

The output current transient time in the TLC5928 is very fast. In addition, all outputs turn on or off at the same time to minimize the output on-time error. This high current demand can cause GND to shift in the entire system, and lead to false triggering of signals. To overcome this issue, design all GND lines to be as wide and short as possible in order to reduce parasitic inductance and resistance.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
